

Software Engineering Lab (24B11CS223)

Project Report Format and Guidelines

Submission Guidelines

- Final Project Evaluation and viva will be scheduled from **1st May -8th May** in your respective Lecture.
- Bring **hardcopy** of the project report at the time of viva and submit a soft copy in your respective Google classrooms.
- Submit **Full Code Dump** (zip file) on Google classroom.

Report Format

- Min 30 pages (Times New Roman font, size 12 for text and 14 for heading).
- Front Page (Stick to the format of front page attached)
- Table of Contents with page numbers against each content.
- Customer Problem Statement
 - a. Problem Statement

A minimum 1-page high-level narrative about your project. The narrative should *not* be written from the developer's perspective, describing the features of the planned system. Rather, put yourself into a customer's role, and write your problem statement as if your imagined customer would write it! Describe the problem that your customer is facing and his or her suggestions about how a software system could help.
 - b. Decomposition into Sub-problems

Based on the problem statement, specify how you decomposed the overall problem into sub-problems.

 - Goals, Requirements, and Analysis
 - a. Business Goals

Structure the goals hierarchically; so that the relationship between the goals and sub-goals is clear.
 - b. Enumerated Functional Requirements

Extract the requirements from the customer's narrative and list them in a table, one row per requirement. The first column shows a unique label "REQ-x". The second column shows an assigned *Priority Weight* of this requirement. The third column briefly describes the requirement.
 - c. Enumerated Non-functional Requirements

List, prioritize, and describe the requirements. The non-functional requirements numbering should continue the functional requirements list.
- Use Cases

Derive the use cases based on the requirements.

 - a. Stakeholders

Identify anyone and everyone who has interest in this system (users, managers, sponsors, etc.). Stakeholders should be humans or human organizations.
 - b. Actors and Goals

Identify the *roles* of people or devices that will directly interact with the system,

their *types* (initiating vs. participating) and the *goals* of the initiating actors.

c. Use Case Diagram

- Class Diagram
- Activity Diagram
- Sequence Diagram
- Implementation (including screenshots with explanation)
- Test Case Report

Generate Test cases of all functional requirements. Test Case report should contain all 'Pass' and 'Fail' cases.

- Contribution of each member of team
